SELF-DIAGNOSTIC FUNCTION

The units in this manual contain a self-diagnostic function. If an error occurs, the STANDBY/TIMER LED will automatically begin to flash. The number of times the LED flashes translates to a probable source of the problem. A definition of the STANDBY/TIMER LED flash indicators is listed in the instruction manual for the user's knowledge and reference. If an error symptom cannot be reproduced, the Remote Commander can be used to review the failure occurrence data stored in memory to reveal past problems and how often these problems occur.

Diagnostic Test Indicators

When an error occurs, the STANDBY/TIMER LED will flash a set number of times to indicate the possible cause of the problem. If there is more than one error, the LED will identify the first of the problem areas.

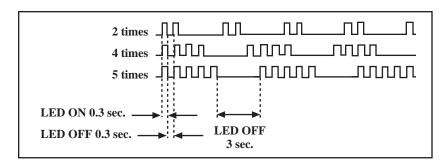

Results for all of the following diagnostic items are displayed on screen. No error has occurred if the screen displays a "0".

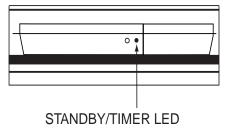

Diagnostic Item Description	No. of Times STANDBY/TIMER LED Flashes	Self-diagnostic Display/ Diagnostic Result	Probable Cause Location	Detected Symptoms
Power does not turn on	Does not light		Power cord is not plugged in. Fuse F5050 is burned out (E board).	Power does not come on.No power is supplied to the TV.AC power supply is faulty.
+B overcurrent (OCP)*	2 times	2:0 or 2:1	H.OUT (Q502) is shorted (A Board) IC1751 (C board) or IC 1701(CV Board) are shorted.	Power does not come on. Load on power line is shorted.
Vertical deflection stopped*	4 times	4:0 or 4:1	+13V is not supplied. (A Board) IC541 is faulty. (A Board)	 Has entered standby state after horizontal raster. Vertical deflection pulse is stopped. Power line is shorted or power supply is stopped.
White balance failure (not balanced)	5 times	5:0 or 5:1	Video OUT (Q306 to 308) is faulty. (A Board) IC301 is faulty. (A Board) Screen (G2) is improperly adjusted.**	No raster is generated. CRT cathode current detection reference pulse output is small.

^{*} If a +B overcurrent is detected, stoppage of the vertical deflection is detected simultaneously. The symptom that is diagnosed first by the microcontroller is displayed on the screen.

^{**} Refer to Screen (G2) Adjustments in Section 3-4 of this manual.

Display of Standby/Timer LED Flash Count

Diagnostic Item	Flash Count*
+B overcurrent	2 times
Vertical deflection stopped	4 times
White balance failure	5 times

^{*}One flash count is not used for self-diagnostic.

Stopping the Standby/Timer LED Flash

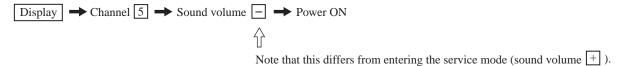

Turn off the power switch on the TV main unit or unplug the power cord from the outlet to stop the STANDBY/TIMER LED from flashing.

Self-Diagnostic Screen Display

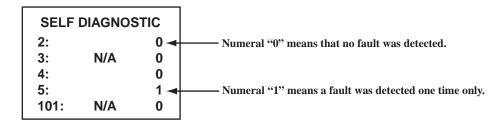

For errors with symptoms such as "power sometimes shuts off" or "screen sometimes goes out" that cannot be confirmed, it is possible to bring up past occurrences of failure on the screen for confirmation.

To Bring Up Screen Test

In standby mode, press buttons on the Remote Commander sequentially, in rapid succession, as shown below:

Self Diagnostic Screen Display

Handling of Self-diagnostic Screen Display

Since the diagnostic results displayed on the screen are not automatically cleared, always check the self-diagnostic screen during repairs. When you have completed the repairs, clear the result display to "0".

Unless the result display is cleared to "0", the self-diagnostic function will not be able to detect subsequent faults after completion of the repairs.

Clearing the Result Display

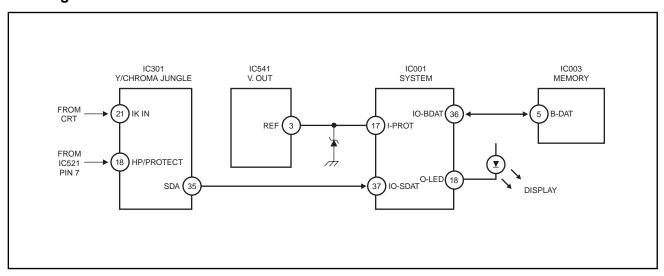

To clear the result display to "0", press buttons on the Remote Commander sequentially when the diagnostic screen is displayed, as shown below:

Channel 8 → ENTER

Quitting the Self-Diagnostic Screen

To quit the entire self-diagnostic screen, turn off the power switch on the Remote Commander or the main unit.

Self-diagnostic Circuit

+B overcurrent (OCP) Occurs when an overcurrent on the +B (115V) line is detected by pin 18 of IC301. If the voltage

of pin 18 of IC301 is less than 1V when V.SYNC is more than seven verticals in a period, the

unit will automatically turn off.

Vertical deflection stopped Occurs when an absence of the vertical deflection pulse is detected by pin 17 of IC001. Power

supply will shut down when waveform interval exceeds 2 seconds.

detected by IC301. TV will stay on, but there will be no picture.

*(Refers to the RGB levels of the AKB detection Ref pulse that detects 1K.)

SAFETY CHECK-OUT

After correcting the original service problem, perform the following safety checks before releasing the set to the customer:

- Check the area of your repair for unsoldered or poorly soldered connections. Check the entire board surface for solder splashes and bridges.
- 2. Check the interboard wiring to ensure that no wires are "pinched" or touching high-wattage resistors.
- Check that all control knobs, shields, covers, ground straps, and mounting hardware have been replaced.
 Be absolutely certain that you have replaced all the insulators.
- Look for unauthorized replacement parts, particularly transistors, that were installed during a previous repair. Point them out to the customer and recommend their replacement.
- Look for parts which, though functioning, show obvious signs of deterioration. Point them out to the customer and recommend their replacement.
- Check the line cords for cracks and abrasion. Recommend the replacement of any such line cord to the customer.
- Check the B+ and HV to see if they are specified values. Make sure your instruments are accurate; be suspicious of your HV meter if sets always have low HV.
- Check the antenna terminals, metal trim, "metallized" knobs, screws, and all other exposed metal parts for AC leakage. Check leakage as described below.

Leakage Test

The AC leakage from any exposed metal part to earth ground and from all exposed metal parts to any exposed metal part having a return to chassis, must not exceed 0.5 mA (500 microampere). Leakage current can be measured by any one of three methods.

- A commercial leakage tester, such as the Simpson 229 or RCA WT-540A. Follow the manufacturers' instructions to use these instructions.
- A battery-operated AC milliammeter. The Data Precision 245 digital multimeter is suitable for this job.
- 3. Measuring the voltage drop across a resistor by means of a VOM or battery-operated AC voltmeter. The "limit" indication is 0.75 V, so analog meters must have an accurate low voltage scale. The Simpson's 250 and Sanwa SH-63Trd are examples of passive VOMs that are suitable. Nearly all battery-operated digital multimeters that have a 2 VAC range are suitable (see Figure A).

How to Find a Good Earth Ground

A cold-water pipe is a guaranteed earth ground; the coverplate retaining screw on most AC outlet boxes is also at earth ground. If the retaining screw is to be used as your earth ground, verify that it is at ground by measuring the resistance between it and a cold-water pipe with an ohmmeter. The reading should be zero ohms. If a cold-water pipe is not accessible, connect a 60- to 100-watt trouble light (not a neon lamp) between the hot side of the receptacle and the retaining screw. Try both slots, if necessary, to locate the hot side on the line; the lamp should light at normal brilliance if the screw is at ground potential (see Figure B).

To avoid electric shock, discharge CRT *before* attempting to remove the anode cap. Short between anode and CRT coated earth ground strap.

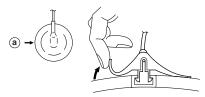

ANODE CAP REMOVAL

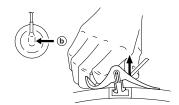

WARNING: High voltage remains in the CRT even after the power is disconnected. To avoid electrical shock, discharge the CRT **before** attempting to remove the anode cap. Short between anode and coated earth ground strap of CRT.

NOTE: After removing the anode, short circuit the anode of the picture tube and the anode cap to either the metal chassis, CRT shield, or carbon painted on the CRT.

REMOVAL PROCEDURES

1 Turn up one side of the rubber cap in the direction indicated by arrow (a).

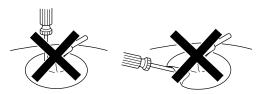

② Use your thumb to pull the rubber cap firmly in the direction indicated by arrow (b).

When one side of the rubber cap separates from the anode button, the anode cap can be removed by turning the rubber cap and pulling it in the direction of arrow (c).

HOW TO HANDLE AN ANODE CAP

- ① Do not use sharp objects which may cause damage to the surface of the anode cap.
- ② To avoid damaging the anode cap, do not squeeze the rubber covering too hard. A material fitting called a shatter-hook terminal is built into the rubber.
- ③ Do not force turn the foot of the rubber cover. This may cause the shatter-hook terminal to protrude and damage the rubber.

SECTION 3 SET-UP ADJUSTMENTS

The following adjustments should be made when a complete realignment is required or when a new picture tube is installed.

These adjustments should be performed with rated power supply voltage unless otherwise noted.

Set the controls and switch as follows unless otherwise noted.

PICTURE control Normal BRIGHTNESS control Normal

Perform the adjustments in order as follows:

- 1. Beam Landing
- 2. Convergence
- 3. Focus
- 4. Screen (G2)
- 5. White Balance

Note: Test equipment required:

- Color bar pattern generator
- Degausser
- · DC power supply
- · Digital multimeter

3-1. BEAM LANDING

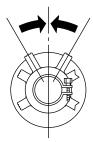

Before beginning adjustment procedure:

- 1. Degauss the entire screen.
- 2. Feed in the white pattern signal.

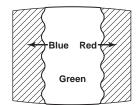

Adjustment Procedure

- 1. Input a raster signal with the pattern generator.
- 2. Loosen the deflection yoke mounting screw and set the purity control to the center as shown below.

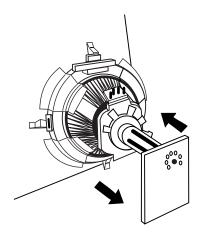

Purity Control

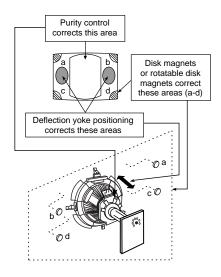

- 3. Turn the raster signal of the pattern generator to green.
- Move the deflection yoke backward and adjust the purity control so that green is in the center and red and blue are at the sides evenly.

5. Move the deflection yoke forward and adjust so that the entire screen becomes green.

- Switch over the raster signal to red and blue then confirm the condition.
- 7. When the position of the deflection yoke is determined, tighten it with the deflection yoke mounting screw.
- 8. If landing at the corner is not right, adjust by using the disk magnets.

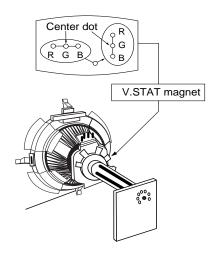

3-2. CONVERGENCE

Before starting convergence adjustments:

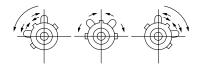

- 1. Perform FOCUS, V.LIN AND V.SIZE adjustments.
- 2. Set BRIGHTNESS control to minimum.
- 3. Feed in dot pattern.

Vertical Static Convergence

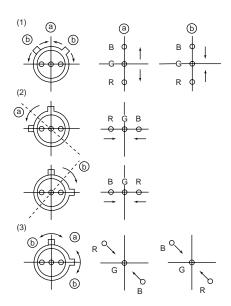

1. Adjust V.STAT magnet to converge red, green and blue dots in the center of the screen (vertical movement).

2. Tilt the V.STAT magnet and adjust static convergence to open or close the V.STAT magnet.

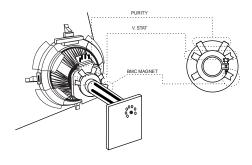

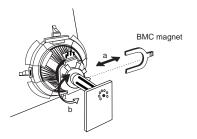

When the V.STAT magnet is moved in the direction of arrows (a) and (b), red, green, and blue dots move as shown below:

If the blue dot does not converge with the red and green dots, perform the following:

- 1. Move BMC magnet (a) to correct insufficient H. Static convergence.
- 2. Rotate BMC magnet (b) to correct insufficient V. Static convergence.
- 3. In either case, repeat Beam Landing Adjustment.

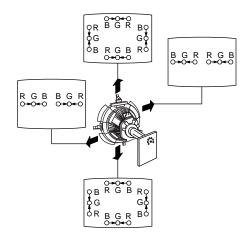

Dynamic Convergence Adjustment

Before performing this adjustment, perform Horizontal and Vertical Static Convergence Adjustment.

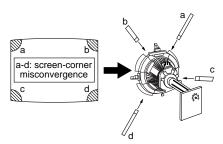

- 1. Slightly loosen deflection yoke screw.
- 2. Remove deflection yoke spacers.
- 3. Move the deflection yoke for best convergence, as shown below:

- 4. Tighten the deflection yoke screw.
- 5. Install the deflection yoke spacers.

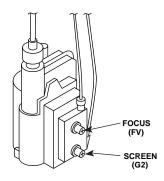

Screen-Corner Convergence

1. Affix a permalloy assembly corresponding to the misconverged areas.

3-3. FOCUS

1. Adjust FOCUS control for best picture.

3-4. SCREEN (G2)

- 3. Confirm the voltage of A Board TP-600 is 135 ± 3 VDC.
- 4. Connect the digital voltmeter and the DC power supply via diode 1SS119 to C574 (+) and ground. (See Figure 1 on the following page.)
- Increase the DC power voltage gradually until the picture blanks out.
- 6. Read the digital voltmeter indication. (standard: less than or equal to 141.3 VDC).
- 7. Turn DC power source off immediately
- Input a white signal and set PICTURE and BRIGHTNESS to maximum.
- 9. Repeat steps 4 to 7.

Hold-down Readjustment

If the setting indicated in step 2 of Hold-down Operation Confirmation cannot be met, readjustment should be performed by altering the resistance value of R584, a component marked with \blacksquare .

4-2. B+ VOLTAGE CONFIRMATION AND ADJUSTMENT

Note: The following adjustments should always be performed when replacing the following components, which are marked with \square on the schematic diagram.
